pyavrutils

Date August 22, 2011

PDF pyavrutils.pdf

Contents:

pyavrutils can build AVR and arduino code from python

Links:

- home: https://github.com/ponty/pyavrutils
- documentation: http://ponty.github.com/pyavrutils

Features:

- python wrapper for avr-gcc, avr-size, arscons
- build files or strings (strings are saved as temp files)
- MCU list
- get code size using avr-size
- avr-gcc default is optimized for size

Known problems:

- Python 3 is not supported
- temp files are not removed
- **arscons has some problems:**
  - it builds bigger programs
  - compile error in some cases

Possible usage:

- experimenting with flags
- building from paver
- unit tests
- building arduino code without GUI

CHAPTER

ONE

BASIC USAGE

```
>>> from pyavrutils import AvrGcc
>>> cc = AvrGcc()
>>> cc.build('int main(){}')
>>> cc.size().program_bytes
66

>>> from pyavrutils import Arduino
>>> cc = Arduino()
>>> cc.mcu = 'atmega8'
>>> cc.build('void setup(){};void loop(){}')
>>> cc.size().program_bytes
1612
```

CHAPTER

TWO

INSTALLATION

2.1 General

- arscons is already included in the library
- install setuptools
- install gcc-avr
- install scons (only for arscons)
- install arduino (only for arscons)
- install the program:

if you have setuptools installed:

```
# as root
easy_install pyavrutils
```

2.2 Ubuntu

```
sudo apt-get install python-setuptools
sudo apt-get install binutils-avr
sudo apt-get install gcc-avr
sudo apt-get install scons
sudo apt-get install arduino
sudo easy_install pyavrutils
```

2.3 Uninstall

using pip:

```
# as root
pip uninstall pyavrutils
```

CHAPTER

THREE

USAGE

3.1 AVR

```
>>> from pyavrutils import AvrGcc
>>> cc = AvrGcc(mcu='atmega48')
>>> cc.targets
['at43usb320', 'at43usb355', 'at76c711', 'at86rf401', 'at90c8534', 'at90can128', 'at90can32', 'at90ca
>>> cc.options_generated()
['avr-gcc', '-Df_cpu=4000000', '-mmcu=atmega48', '--std=gnu99', '-Wl,--relax', '-Wl,--gc-sections', '
>>> cc.build('int main(){}')
>>> cc.output
'/tmp/pyavrutils_bhbm0Y.elf'
>>> cc.size()
AvrSize <prog:80 bytes 2.0% mem:0 bytes 0.0% >
>>> cc.size().program_bytes
80
>>> cc.mcu='atmega168'
>>> cc.options_generated()
['avr-gcc', '-Df_cpu=4000000', '-mmcu=atmega168', '--std=gnu99', '-Wl,--relax', '-Wl,--gc-sections',
>>> cc.build('int main(){}')
>>> cc.output
'/tmp/pyavrutils_bhbm0Y.elf'
>>> cc.size().program_bytes
132
```

3.2 arduino

```
>>> from pyavrutils import Arduino
>>> cc = Arduino(board='mini')
>>> cc.build('void setup(){};void loop(){}')
>>> cc.output
path('/tmp/pyavrutils_Gr4hp9/pyavrutils_Kd6kF4/pyavrutils_Kd6kF4.elf')
>>> cc.size()
AvrSize <prog:1802 bytes 11.0% mem:191 bytes 18.7% >
>>> cc.size().program_bytes
1802
>>> cc.board='pro'
>>> cc.build('void setup(){};void loop(){}')
>>> cc.output
path('/tmp/pyavrutils_6pCE0M/pyavrutils_La5_yg/pyavrutils_La5_yg.elf')
```

```
>>> cc.size().program_bytes
1826
```

CHAPTER

FOUR

EXAMPLES

4.1 Simple example

Example program:

```
'''
test minimum program size with different optimizations
'''

from pyavrutils import AvrGcc
from entrypoint2 import entrypoint

cc = AvrGcc()
code = 'int main(){}'

def test():
    print '    compiler option:', ' '.join(cc.options_generated())
    cc.build(code)
    print '    program size =', cc.size().program_bytes

@entrypoint
def main():
    print 'compiler version:', cc.version()
    print 'code:', code
    print
    print 'no optimizations::'
    print
    cc.optimize_no()
    test()
    print
    print 'optimize for size::'
    print
    cc.optimize_for_size()
    test()
```

Output:

```
$ python -m pyavrutils.examples.simple
compiler version: 4.3.5
code: int main(){}

no optimizations::

    compiler option: avr-gcc -Df_cpu=4000000 -mmcu=atmega168 --std=gnu99
```

```
    program size = 150

optimize for size::

    compiler option: avr-gcc -Df_cpu=4000000 -mmcu=atmega168 --std=gnu99 -Wl,--relax -Wl,--gc-sectio
    program size = 132
```

4.2 Test size with unused code

Example program:

```
from pyavrutils.avrgcc import AvrGcc
from entrypoint2 import entrypoint

cc = AvrGcc()

def test_option(sources, optimization, gc_sections=0, ffunction_sections=0):
    print 'optimization =', optimization,
    print 'gc_sections =', gc_sections,
    print 'ffunction_sections =', ffunction_sections,
    print

    cc.optimization = optimization
    cc.gc_sections = gc_sections
    cc.ffunction_sections = ffunction_sections
    try:
        cc.build(sources)
        size = cc.size()
        print 'program, data =', str(size.program_bytes).rjust(8) , ',', str(size.data_bytes).rjust(8
    except:
        print  'compile error'

def test(sources):
    print 'sources:', sources
    test_option(sources, 0)
    test_option(sources, 's',0)
    test_option(sources, 's',1)
    test_option(sources, 's',1,1)

@entrypoint
def main():
    cc.optimize_no()
    print  'compiler version:', cc.version()
    print  'compiler options:', ' '.join(cc.options_generated())
    print
    print 'minimum size'
    print 20 * '='
    test(['int main(){}'])

    print
    print 'unused function in separate file'
    print 40 * '='
    test(['int main(){}', 'int f(){return 2;}'])

    print
    print 'unused function in the same file'
```

```
    print 40 * '='
    test(['int main(){}; int f(){return 2;}'])
```

Output:

```
$ python -m pyavrutils.examples.deadcode
compiler version: 4.3.5
compiler options: avr-gcc -Df_cpu=4000000 -mmcu=atmega168 --std=gnu99

minimum size
====================
sources: ['int main(){}']
optimization = 0 gc_sections = 0 ffunction_sections = 0
program, data =      150 ,        0
optimization = s gc_sections = 0 ffunction_sections = 0
program, data =      138 ,        0
optimization = s gc_sections = 1 ffunction_sections = 0
program, data =      138 ,        0
optimization = s gc_sections = 1 ffunction_sections = 1
program, data =      138 ,        0

unused function in separate file
========================================
sources: ['int main(){}', 'int f(){return 2;}']
optimization = 0 gc_sections = 0 ffunction_sections = 0
program, data =      168 ,        0
optimization = s gc_sections = 0 ffunction_sections = 0
program, data =      144 ,        0
optimization = s gc_sections = 1 ffunction_sections = 0
program, data =      138 ,        0
optimization = s gc_sections = 1 ffunction_sections = 1
program, data =      138 ,        0

unused function in the same file
========================================
sources: ['int main(){}; int f(){return 2;}']
optimization = 0 gc_sections = 0 ffunction_sections = 0
program, data =      168 ,        0
optimization = s gc_sections = 0 ffunction_sections = 0
program, data =      144 ,        0
optimization = s gc_sections = 1 ffunction_sections = 0
program, data =      144 ,        0
optimization = s gc_sections = 1 ffunction_sections = 1
program, data =      138 ,        0
```

Conclusions:

- both `gc_sections` and `ffunction_sections` should be used

4.3 Test size with delay.h

Example program:

```
from pyavrutils.avrgcc import AvrGcc
from entrypoint2 import entrypoint

templ = '''
```

```
#include <avr/io.h>
#include <util/delay.h>
int main()
{
    %s;
    return 0;
}
'''

cc = AvrGcc()
cc.optimize_no()
print  'compiler version:', cc.version()
print

def test(snippet, option=''):
    print  snippet.ljust(33) ,
    cc.options_extra = option.split()
    print  'compiler option:', option, '\t',
    try:
        cc.build([templ % snippet])
        size = cc.size()
        print 'program, data =', str(size.program_bytes).rjust(8) , ',', str(size.data_bytes).rjust(8
    except:
        print  'compile error'

@entrypoint
def main():
    cc.optimization = 0

    test('_delay_ms(4)', '-O0')
    test('_delay_ms(4)', '-O1')
    test('_delay_ms(4)', '-O2')
    test('_delay_ms(4)', '-O3')
    test('_delay_ms(4)', '-Os')

    test('volatile double x=3;_delay_ms(x)', '-Os')
```

Output:

```
$ python -m pyavrutils.examples.delaysize
compiler version: 4.3.5

_delay_ms(4)                      compiler option: -O0        program, data =     3282 ,        8
_delay_ms(4)                      compiler option: -O1        program, data =      146 ,        0
_delay_ms(4)                      compiler option: -O2        program, data =      146 ,        0
_delay_ms(4)                      compiler option: -O3        program, data =      146 ,        0
_delay_ms(4)                      compiler option: -Os        program, data =      146 ,        0
volatile double x=3;_delay_ms(x)  compiler option: -Os        program, data =     3218 ,        8
```

Conclusions:

- parameter should be constant
- optimization should be 1, 2, 3 or s

4.4 Test size with program space

Example program:

```
from pyavrutils.avrgcc import AvrGcc
from entrypoint2 import entrypoint

templ = '''
#include <avr/io.h>
#include <avr/pgmspace.h>
int main()
{
    %s;
    return 0;
}
'''

cc = AvrGcc()
cc.optimization=0
print  'compiler version:', cc.version()
print  'compiler options:', ' '.join(cc.options_generated())
print

def test(snippet):
    print  snippet ,'\t\t',
    try:
        cc.build([templ % snippet])
        size = cc.size()
        print 'program, data =', str(size.program_bytes).rjust(8) , ',', str(size.data_bytes).rjust(8
    except:
        print  'compile error'

def test_comb(s):
    words='static const PROGMEM'.split()
    def choice(i):
        return [words[i],' '*len(words[i])]

    for s0 in choice(0):
        for s1 in choice(1):
            for s2 in choice(2):
#                   for s3 in choice(3):
                    test('%s %s char s[] %s = "%s"' % (s0,s1,s2,s))
@entrypoint
def main():
    test_comb("12345")
    test_comb("1234512345")
```

Output:

```
$ python -m pyavrutils.examples.pgmspace
compiler version: 4.3.5
compiler options: avr-gcc -Df_cpu=4000000 -mmcu=atmega168 --std=gnu99 -Wl,--relax -Wl,--gc-sections -

static const char s[] PROGMEM = "12345"                 program, data =      144 ,        0
static const char s[]         = "12345"                 program, data =      166 ,        0
static       char s[] PROGMEM = "12345"                 program, data =      144 ,        0
static       char s[]         = "12345"                 program, data =      166 ,        0
```

```
       const char s[] PROGMEM = "12345"                program, data =      260 ,         6
       const char s[]         = "12345"                program, data =      260 ,         6
             char s[] PROGMEM = "12345"                program, data =      260 ,         6
             char s[]         = "12345"                program, data =      260 ,         6
static const char s[] PROGMEM = "1234512345"               program, data =      144 ,         0
static const char s[]         = "1234512345"               program, data =      166 ,         0
static       char s[] PROGMEM = "1234512345"               program, data =      144 ,         0
static       char s[]         = "1234512345"               program, data =      166 ,         0
       const char s[] PROGMEM = "1234512345"               program, data =      266 ,        12
       const char s[]         = "1234512345"               program, data =      266 ,        12
             char s[] PROGMEM = "1234512345"               program, data =      266 ,        12
             char s[]         = "1234512345"               program, data =      266 ,        12
```

Conclusions:

- constant string should be static or global
- `const` has no effect on size
- PROGMEM should be used

4.5 Test minimum size

Example program:

```
'''
test minimum program size with all MCUs
'''

from entrypoint2 import entrypoint
from pyavrutils.avrgcc import AvrGcc, AvrGccCompileError

def test(cc, mcu):
    print 'MCU =', mcu.ljust(20),
    cc.mcu = mcu
    try:
        cc.build(cc.minprog)
        print '    program/data size =', cc.size().program_bytes, ',', cc.size().data_bytes
    except AvrGccCompileError:
        print '    compile error:', cc.error_text.splitlines()[0]

@entrypoint
def main():
    cc = AvrGcc()
    print '--------------'
    print 'avr-gcc'
    print '--------------'

    print 'compiler version:', cc.version()
    cc.optimize_for_size()
    print 'compiler options:', ' '.join(cc.options_generated())
    print 'code:', cc.minprog
    print
    for mcu in cc.targets:
        test(cc, mcu)
```

Output:

```
$ python -m pyavrutils.examples.minsize
--------------
avr-gcc
--------------
compiler version: 4.3.5
compiler options: avr-gcc -Df_cpu=4000000 -mmcu=atmega168 --std=gnu99 -Wl,--relax -Wl,--gc-sections -
code: int main(){};

MCU = at43usb320              program/data size = 80 , 0

CHAPTER

SIX

API

class pyavrutils.**AvrGcc**(*mcu='atmega168'*)

build(*sources=None*, *headers=None*)
sources can be file name or code: sources=['x.c','int main(){}'] or sources='int main(){}'

command_list(*sources*, *_opt=False*)
command line as list

error_text

ok

optimize_for_size()
http://www.avrfreaks.net/index.php?name=PNphpBB2&file=viewtopic&t=90752

http://www.avrfreaks.net/index.php?name=PNphpBB2&file=viewtopic&t=69813

optimize_no()
all options set to default

options_generated()

size()

targets

version()
avr-gcc version

class pyavrutils.**AvrSize**
wrapper for avr-size

ok

parse_output(*s*)
Example output:

Device: atmega2561

Program: 4168 bytes (1.6% Full) (.text + .data + .bootloader)

Data: 72 bytes (0.9% Full) (.data + .bss + .noinit)

run(*objfile*, *mcu*)

class pyavrutils.**Arduino**(*board='pro'*, *hwpack='arduino'*, *mcu=None*, *f_cpu=None*, *extra_lib=None*, *ver=None*, *home='auto'*)
wrapper for arscons

build(*sources=None*)

command_list()
command line as list

error_text

mcu_compiler()

ok

size()

CHAPTER

SEVEN

DEVELOPMENT

7.1 Tools

1. setuptools
2. Paver
3. nose
4. ghp-import
5. pyflakes
6. pychecker
7. paved fork
8. Sphinx
9. sphinxcontrib-programscreenshot
10. sphinxcontrib-paverutils
11. `autorun` from sphinx-contrib (there is no simple method, you have to download/unpack/setup)

7.2 Install on ubuntu

```
sudo apt-get install python-setuptools
sudo apt-get install python-paver
sudo apt-get install python-nose
sudo easy_install ghp-import
sudo apt-get install pyflakes
sudo apt-get install pychecker
sudo easy_install https://github.com/ponty/paved/zipball/master
sudo apt-get install scrot
sudo apt-get install xvfb
sudo apt-get install xserver-xephyr
sudo apt-get install python-imaging
sudo apt-get install python-sphinx
sudo easy_install sphinxcontrib-programscreenshot
sudo easy_install sphinxcontrib-programoutput
sudo easy_install sphinxcontrib-paverutils
```

7.3 Tasks

Paver is used for task management, settings are saved in pavement.py. Sphinx is used to generate documentation.

print paver settings:

```
paver printoptions
```

clean generated files:

```
paver clean
```

generate documentation under *docs/_build/html*:

```
paver cog pdf html
```

upload documentation to github:

```
paver ghpages
```

run unit tests:

```
paver nose
#or
nosetests --verbose
```

check python code:

```
paver pyflakes
paver pychecker
```

generate python distribution:

```
paver sdist
```

upload python distribution to PyPI:

```
paver upload
```
